

## How to install the R library

First, unzip `installation_package.zip` into directory D.

Directory D now contains several files, including a file named `iRRAp.gz`

To install using Rstudio, open Rstudio, select tab “Packages” and click “install.” You get the a window like this:

Select Install from: Package Archive File

Select the `iRRAp.gz` file from the directory where you have placed the file.

Choose the library location you prefer (in general the default is fine)

Click Install, and that’s all.

In case of problems with the installation via Rstudio, you can install the package directly via R, as follows.

Go to the directory containing `iRRAp.gz` and open the R environment (in this way the R working directory is the one where `iRRAp.gz` is located).

In the R environment give the command

```
install.packages("iRRAp.gz", repos = NULL, type = "source")
```

That should make the trick.
